touch™ IMMUNOLOGY

# Agenda

- **Introduction and welcome**
  *Prof. John Stone*
- **The many faces of IgG4-related disease**
  *Prof. John Stone*
- **From suspicion to confirmation of IgG4-related disease**
  *Dr Emanuel Della Torre*
- **A new era for treating IgG4-related disease**
  *Dr Arezou Khosroshahi*
- **Panel discussion**
  *All faculty*
- **Meeting summary and close**
  *Prof. John Stone*

***Each session will include interactive audience polling and audience Q&As. The panel discussion will include a patient case.***

touch™ IMMUNOLOGY

# Learning objectives

1. Describe the complex pathophysiology and clinical manifestations of IgG4-related disease
2. Outline the diagnostic and classification criteria for IgG4-related disease
3. Discuss current treatments for IgG4-related disease as well as novel, emerging targeted treatment options

# Expert panel

**Prof. John Stone (Chair)**
Harvard Medical School and
Massachusetts General Hospital
Boston, MA, USA

**Dr Emanuel Della Torre**
Vita-Salute San Raffaele University
and San Raffaele Hospital
Milan, Italy

**Dr Arezou Khosroshahi**
Emory University School of Medicine
Atlanta, GA, USA

touch™ IMMUNOLOGY

# The many faces of IgG4-related disease

**Prof. John Stone**
Harvard Medical School and
Massachusetts General Hospital
Boston, MA, USA

# IgG4-RD was first identified in 2003[1]

True **prevalence** is unknown[2]

Average age at diagnosis is **50–70 years old**[2]

**Male** predominance[2]

**Immune-mediated progressive** condition[1–3]

**Relapsing–remitting** disease course[2]

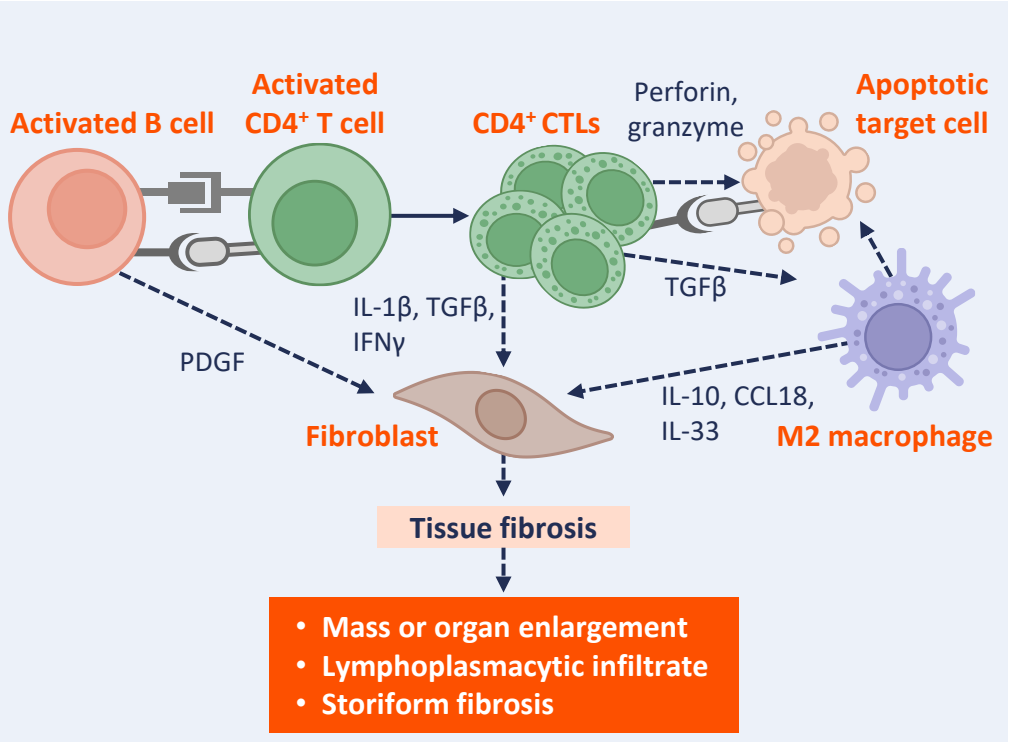
**Smoking** is the only established modifiable risk factor[2]

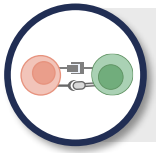
IgG4-RD, immunoglobulin G4-related disease.

1. Tanaka Y, Stone JH. *Modern Rheumatol.* 2023;33:229–36; 2. Katz G, Stone JH. *Ann Rev Med.* 2022;73;545–62; 3. Perguino CA, Stone JH. *Nat Rev Rheumatol.* 2020;16:702–14.

touch™ IMMUNOLOGY

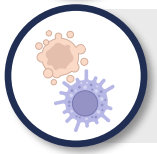
# Pathogenesis of IgG4-RD leads to tissue fibrosis





**Activated B cells** migrate to inflamed tissues and **promote T-cell expansion and differentiation** into CD4⁺ CTLs

**CD4⁺ CTLs induce apoptosis** by releasing perforin and granzyme



**Activated M2 macrophages clear apoptotic cells**

**Activated immune cells promote activation of fibroblasts**

**Fibroblasts secrete ECM proteins, resulting in tissue remodelling and fibrosis**

CCL18, CC-chemokine 18; CD, cluster of differentiation; CTLs, cytotoxic T lymphocytes; ECM, extracellular matrix; IFNγ, interferon-γ; IgG4-RD, immunoglobulin G4-related disease; IL, interleukin; PDGF, platelet-derived growth factor; TGFβ, transforming growth factor-β.

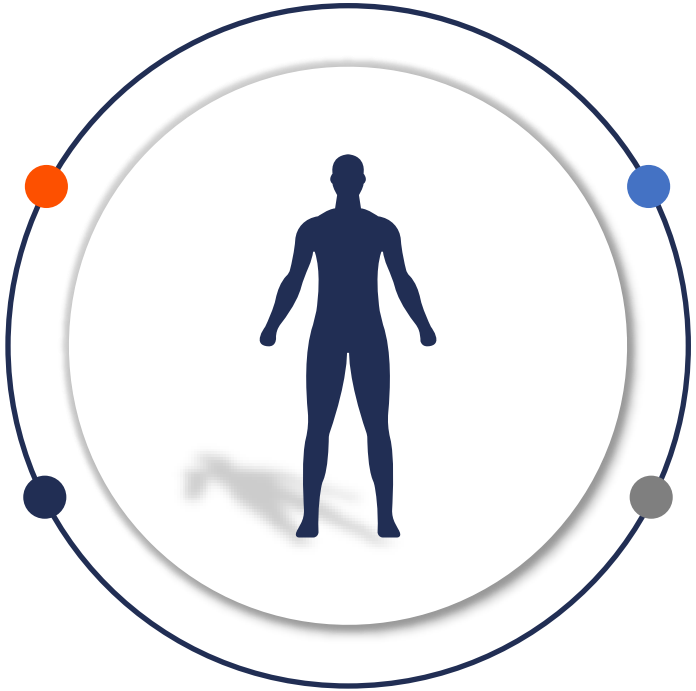
Perugino CA, Stone JH. *Nat Rev Rheumatol*. 2020;16:702–14.

touch™ IMMUNOLOGY

# Clinical presentation of IgG4-RD is heterogeneous[1]

Typically presents in an indolent fashion[1]

Most common presentation is a mass lesion or organ enlargement[2]



Mass lesions are frequently mistaken for malignancy[1]

Symptoms are typically attributable to tumefactive or inflammatory lesion(s)[3]

IgG4-RD, immunoglobulin G4-related disease.

touch™ IMMUNOLOGY

# Two subtypes of IgG4-RD have been described

## Proliferative subtype[1]

**Multiorgan involvement**
Glandular tissues, pancreas, bile ducts, kidneys, lungs, sinuses and lymph nodes

**IgG4:** ↑
**IgE:** ↑
**IgG1:** ↑
**Eosinophils:** ↑
**Complement levels:** ↓

**Treatment responsive**

## Fibrotic subtype[1]

**Single or multiorgan involvement**
Retroperitoneum, mesentery, mediastinum, pachymeninges and thyroid

**IgG4:** Normal
**IgE:** Normal
**IgG1:** Normal
**Eosinophils:** Not characteristic
**Hypocomplementemia:** Not characteristic

**Limited treatment response**

**Biological differences between these subtypes remains uncertain[2]**

touch™ IMMUNOLOGY

# Summary

**IgG4-RD was recognized** as a distinct autoimmune disease **two decades ago**[1,2]

**IgG4-RD is an insidiously progressive disease** typified by tumour-like mass formation in many organs[2]

**Typical organs affected by IgG4-RD** are the lacrimal glands, major salivary glands, orbits, lungs, paravertebral soft tissue, pancreas, biliary tree, kidneys, retroperitoneum, aorta, meninges and thyroid gland[1]

**Expanding knowledge of the pathophysiology of IgG4-RD** offers the possibility of **novel therapeutic approaches**[2]

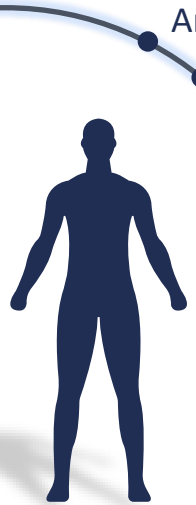
# IgG4-RD represents a diagnostic challenge

## Some differential diagnoses of IgG4-RD[1]



- Amyloidosis
- Atherosclerosis
- Cholangiocarcinoma
- Erdheim–Chester disease
- Giant cell arteritis
- Graves' disease
- ILD
- Lymphoma
- Pancreatic malignancy
- Renal cell carcinoma
- Sarcoidosis
- Sjögren syndrome

**Elevated serum IgG4 levels are not essential for diagnosis[2–4]**

**No specific single marker or clinical feature for a definitive diagnosis[5]**

Ig, immunoglobulin; IgG4-RD, IgG4-related disease; ILD, interstitial lung disease.

# A new era for treating IgG4-related disease

**Dr Arezou Khosroshahi**
Emory University School of Medicine
Atlanta, GA, USA

# Effective management of IgG4-RD

**Induction**
with GCs[1,2]

**Maintenance**
with low-dose GCs, immunosuppression, rituximab (under investigation)[1,2]

**Monitor**
biomarkers of IgG4-RD activity e.g. serum IgG4 levels[3]

## Management should factor in the natural history of IgG4-RD

- Occasional spontaneous remission[4]
- Indolent, progressive organ involvement[5,6]
- Additional organ involvement over time[6]
- Irreversible damage of vital organs[6,7]

GC, glucocorticoid; Ig, immunoglobulin; IgG4-RD, IgG4-related disease.

1. Abraham M, Khosroshahi A. *Expert Rev Clin Immunol*. 2017;13:867–75; 2. Lanzillotta M, et al. *Expert Rev Clin Immunol*. 2021;17:471–83; 3. # Summary

**Treatment decisions should be individualized** based on the natural history of IgG4-RD, as well as patient- and disease-specific factors[1–3]

**GCs remain the cornerstone for inducing disease remission**[4]

Advances in understanding the pathogenesis of IgG4-RD has prompted the **development of novel targeted agents** that may provide steroid-sparing options in the future[4,5]

**Life-long follow-up of patients** with IgG4-RD is advisable[6]

GC, glucocorticoid; IgG4-RD, immunoglobulin G4-related disease.

# Panel discussion

**Prof. John Stone (Chair)**
Harvard Medical School and
Massachusetts General Hospital
Boston, MA, USA

**Dr Emanuel Della Torre**
Vita-Salute San Raffaele University
and San Raffaele Hospital
Milan, Italy

**Dr Arezou Khosroshahi**
Emory University School of Medicine
Atlanta, GA, USA

# Patient case: Presentation

## George

**Age:** 60 years

**Sex:** Male

**Presentation:** *Sudden onset of abdominal pain, jaundice and weight loss. Has a medical history of multiple allergies*

# Patient case: Diagnostic tests

## George

**Age:** 60 years

**Sex:** Male

**Serology:** *Laboratory assessment showed abnormal liver function tests and elevated CA 19-9.*

**Radiology:** *Abdominal ultrasound demonstrated extensive biliary ductal dilatation. CT/MRI/MRCP revealed a 4.6 cm pancreatic head mass.*

CA 19-9, carbohydrate antigen 19-9; CT, computed tomography; MRCP, magnetic resonance cholangiopancreatography; MRI, magnetic resonance imaging.

# Patient case: Diagnostic tests

## George

**Age:** 60 years **Sex:** Male

**Serology:** *Laboratory assessment showed abnormal liver function tests and elevated CA 19-9.*

**Radiology:** *Abdominal ultrasound demonstrated extensive biliary ductal dilatation. CT/MRI/MRCP revealed a 4.6 cm pancreatic head mass.*

**What additional tests would you perform?**

a. **Biopsy to detect malignant cells; immunostain for IgG4**
b. **Measure response to high-dose prednisone**
c. **Measure serum IgG4 levels**
d. **PET-CT to detect pancreatic and extra-pancreatic lesions**

CA 19-9, carbohydrate antigen 19-9; CT, computed tomography; Ig, immunoglobulin; MRCP, magnetic resonance cholangiopancreatography; MRI, magnetic resonance imaging; PET, positron emission tomography.
